

#Introduction This is my build of st terminal. It patched to be effective but not cumbersome.

It supports opening/copying links using rofi and copying previous commands. You can zoom in/out using Alt+Shift+J/K, copy and paste with Alt+c/v.

What is ST?

As described by suckless:

st - simple terminal

st is a simple terminal emulator for X which sucks less.

Requirements

In order to build st you need the Xlib header files.

Installation

Edit config.mk to match your local setup (st is installed into the /usr/local namespace by default).

Afterwards enter the following command to build and install st (if necessary as root):

```
make clean install
```

Running st

If you did not install st with make clean install, you must compile the st terminfo entry with the following command:

```
tic -sx st.info
```

See the man page for additional details.

Credits

Based on Aurélien APTEL bt source code.

Dependencies

- rofi <https://github.com/adi1090x/rofi>
- rofi-dmenu <https://aur.archlinux.org/packages/rofi-dmenu/>
- xdotool
- xdg-utils

Patches

- alpha
- GruvBox-Dark
- AnySize
- ScrollBack
- ExternalPipe
- VertCenter

Running st

You can either open another terminal and type **st&** or you can get an application launcher like rofi or dmenu to do that for you.
